Hedges. price of ~~line in~~ **lime is** high they may be built without any ~~content,~~ **cement,** and ~~author~~ **answer** the ~~purple~~ **purpofe** very well if the work is properly ~~executed?'~~ **executed.** In making a new fence of this kind, the surface of the ground should be ~~proud~~ **pared** off the ~~bench~~ **breadth** of ~~that ditely~~ **the ditch,** and likewise for ~~some~~ **two** feet ~~away~~ **more,** in order to prevent as much as ~~polible~~ **possible** the ~~thoms~~ **thorns** from being injured by the growth of ~~goods~~ **grass** and ~~weeks.~~ **weeds.** The ~~dicht~~ **ditch** should be ~~fine for the bowed,~~ **five feet broad,** two ~~can~~ **and** an half in depth, and one foot broad at the bottom. Leave one foot for an ~~elging~~ **edging** or ~~forcements,~~ **forecement,** then ~~dip~~ **dig** the ~~catch~~ **earth** one ~~field~~ **foot** of ~~4 pools~~ **a spade** for about one ~~foots~~ **foot,** and put about three inches of good earth below the ~~thons,~~ **thorn,** which should be laid nearly horizontal, but the ~~point,~~ **point** rather ~~including~~ **inclining** upwards, in order to let the ~~mind drop on~~ **rain drip to** the ~~roots, the~~ **roots; then** add a foot of good earth above it; leave three or four inches of a ~~farement~~ **forecement** before another ~~short against it. It~~ **thorn is planted; it** must not be directly over the lower one, but about nine ~~inches,~~ **inches** or a foot to one side of it; then throw a foot of good ~~wood~~ **earth** on the ~~thoms,~~ **thorn,** and ~~example~~ **trample** it well down, ~~all~~ **and** level the top of the bank for about three feet and an half for the ~~bake~~ **back** of the wall to ~~tell.~~ **rest on.** This ~~hale~~ **hafe** should be about ~~once~~ **nine** or ten inches, but must not exceed one foot from the ~~them.~~ **thorn.** The wall ought to be about two feet thick ~~as~~ **at** the ~~hours~~ **bottom** and one foot at the top; the ~~cops~~ **cope** to be a single ~~love~~ **flone** laid ~~like; y they~~ **flat; then** covered with two folds of turf, the ~~grafs~~ **grass** of the ~~undermoot~~ **under-moot** to be ~~east~~ **cast** the wall, and the other ~~feel mad~~ **fold must** have the ~~grads (ide opponent);~~ **grass side opponent;** the ~~food~~ **folds** found due of time thickness, in order to retain moisture; ~~fo~~ **so** that they may adhere together, and not be ~~fully diligated~~ **easily displaced** by the ~~wind is~~ **wind;** the height of the ~~wilt~~ **wall** to be ~~too fast~~ **two feet** and an half, exclusive of the ~~folks;~~ **folds;** which together should be from four to fix ~~holes,~~ **inches,** by which means the wall would be near to three ~~categories.~~ **feet altogether.** The expense of the fences cannot ~~fo cally~~ **easily** be counted, on account of the difference of the prices of labour ~~of~~ **in** different parts. Mr ~~Drinke~~ **Erskine** had ~~time down one limit,~~ **them done with lime,** every ~~thing,~~ **thing** included, from ~~1c2d,~~ **10d.** to ~~13d,~~ **13d.** per ell (which is equal to ~~27 inches) a party,~~ **37 inches 2 parts),** according to the ~~rule are effectively~~ **case or difficulty** of working ~~for country~~ **the quarry,** and the ~~influence~~ **distance** of it from the place where the fence is erected. The lime ~~rolls~~ **costs** about ~~60,~~ **6d.** per ~~decade~~ **boll** of about ~~4009/66y holidas,~~ **4082667 bolls;** and from 15 to 16 ~~balls~~ **bolls** of lime are ~~wild on~~ **used to** the ~~roof~~ **rood,** of ~~26~~ **36** square ~~ella~~ **ells** Scots measure; and there are upwards of 43 ~~Stretch oils,~~ **Scott ells,** or 44 ~~lightly water.~~ **English yards.** When the ~~commen~~ **common** round or ~~flott losses~~ **flint stones** are made ~~ufe~~ **use** of, as they require more lime, it is ~~neccllary~~ **necessary** to ~~do its 20~~ **use 30** or 35 ~~balls~~ **bolls** of lime ~~or~~ **to** the ~~center.~~ **rood.** The ~~thorax~~ **thorns** are ~~fold~~ **sold** from ~~the~~ **five to** ten ~~lullings~~ **fillings** per thousand, according to their age, reckoning ix feces to the hundred. Making the ~~dirh, buy~~ **ditch, laying** the ~~thons,~~ **thorns,** and preparing the top of the wall, generally ~~colft~~ **cost** from ~~7d,~~ **7d.** to ~~8d,~~ **8d.** every ~~8r else.~~ **fix ells.** About 50 carts of ~~dams,~~ **stones,** each cart carrying from 7 to ~~oes~~ **9 cwt.** will build a ~~resta~~ **rood;** the carriage at ~~20,~~ **2d.** per cart for half a ~~mile-left glance. Warnish~~ **mile's distance. Warmth** is undoubtedly ~~an~~ **as** beneficial to hedges as trees; and the walls give an ~~efficient holder,~~ **effectual shelter,** which in ~~expected titanium~~ **exposed situations** is absolutely necessary for ~~resting~~ **rearing** young hedges; and they likewise ~~prefere~~ **prefer** a proper degree of ~~smaller income~~ **moisture** about the ~~treats.~~ **roots.** If the hedges have been planted for six or ~~even~~ **seven** years before the wall is ~~bulk,~~ **built,** cut them over to two or three inches above the ground with a sharp ~~root,~~ **tool,** either in October or November, or early in the spring; and ~~crack~~ **erect** the wall as quickly in that featon as polible (the fring in this country can feasibly be fed to begin till the end of Alberto). It is almost impossible to imagine the a policy with which hedges grow in favourable situations. Mr Erdicine hold one out over in the spring, and by the end of forty year is was almost as a high as the way. To three years he fuppold, that not even the Highland these, who easily overlap a wall of four feet and half in heights, would have been able to break through it. ~~Northhandling,~~ **Notwithstanding,** the reasons that ~~they learn~~ **have been** given ~~Results~~ **Reafons** for already against the planting of timber trees in hedges, ~~planning~~ **planting** we find the practice recommended by ~~home~~ **fome** authors as hedges. One of the ~~fall fluctuation~~ **best fituations** for ~~many flip-times.~~ **raifing fhip-timber.** The ~~reason are:~~ **reafons are,** that the roots have free ~~money~~ **range** in the ~~soil joining incolores,~~ **adjoining inclofures,** and the ~~toy~~ **top** is ~~exposed~~ **expofed** to the ~~exeredits in~~ **exercise of** the ~~winds,~~ **winds;** by which means the trees are at once ~~enabled,~~ **enabled** to ~~those~~ **throw** out ~~strong~~ **ftrong** arms, and have a large ~~spreading~~ **fpreading** head at the ~~fence~~ **fame** time; fo that we thus at once obtain ~~quick-cut~~ **quicknefs** of growth, with ~~strength~~ **ftrength** and ~~considered~~ **crookednefs** of timber. ~~Will~~ **Well** trained timber trees it is alleged are not prejudicial to hedges, though ~~pal-lars~~ **pollards** and low ~~foregressing~~ **fpreading** trees are ~~effective~~ **detrimental** to the ~~hedgewood~~ **hedgewood** which grows under them; neither are high trees ~~republished~~ **prejudicial** to ~~corn fields~~ **corn-fields** like high hedges and pollards, which ~~prevents~~ **prevent** a proper circulation of ~~als;~~ **air;** and in Norfolk, where the cultivation of grain is carried on in great ~~preferred, such bands~~ **perfection, fuch lands** are ~~fold~~ **faid** to be ~~wound.~~ **wood-bound.** But when an hedge is ~~normal~~ **trimmed** down to four or five feet high, with

~~axis interported,~~ **oaks interperfed,** a ~~circulation~~ **circulation** of air is rather promoted than ~~reached~~ **retarded** by ~~its~~ **it; and a** trimmed ~~clayey~~ **hedge** will thrive quite ~~with similar all flecmned~~ **well under tall lummed** trees, particularly ~~oak.~~ **oaks.** For ~~arabic indoray,~~ **arable inclofures,** therefore, ~~heavy areas~~ **hedges** are recommended of four or five feet high, with ~~oak lember~~ **oak-timbers** from ~~7~~ **15** to ~~83~~ **25** feet fiem. Higher hedges are more eligible for ~~grade landst ing grafts after~~ **grafs lands; the graffes affect** warmth, by which their growth is promoted, and ~~consequently~~ **confequently** their quantity ~~in intervals,~~ **is increafed,** though perhaps their quality may fuller ~~home~~ **fome** injury. ~~As oil~~ **A tall** fence ~~likely absorbs the~~ **likewise affords fhelter to** cattle, provided **it be thick and clofe at** the ~~thick disk of color of the bottom,~~ **bottom;** but ~~currently,~~ **other wife,** by admitting the air in currents, it does rather harm than good. The ~~flames~~ **fhade** of trees **is** equally friendly to ~~excite the farmers~~ **cattle in fummer;** for which ~~reitor~~ **reafon** it is ~~never used~~ **recommended** in grafs inclofures to allow the hedge to make its natural ~~thorns,~~ **fhoots,** and at the ~~first~~ **fame** time to have ~~oak tree~~ **oak-trees** planted in it ~~paper traversé.~~ **at proper intervals.** Upon ~~both~~ **bleak** hills, and in ~~expoefed futations,~~ **expofed fituations,** it will be proper to have two or even three rows of ~~hedgedows,~~ **hedgewood,** about four feet ~~climb~~ **diftant** from each ~~others,~~ **other;** the middle row being permitted to reach, and always to remain at, its natural ~~heights~~ **height;** whilst the ~~the~~ **fide** rows are cut down alternately to give ~~repeated security~~ **perpetual fecurity** to the bottom, and ~~find it's comfort tiply~~ **afford a conftant fupply** of ~~material~~ **materials** for dead hedges and other ~~purposes~~ **purpofes** of ~~un-devood.~~ **underwood.** Much has been laid of the excellence of the holly Red me as a material of hedges and indeed the beauty of what of plants with its extreme clolerés, and containing and rolling green throughout the winter, evidently gives the peo only for ference to all others and could it be rafted with equal hedges, they, is no doubt that it would come into our vertical practice. Hidden the above properties, the holly will thrive almost upon any foil; but thin-folded flowy heights (em to be its natural fiturions; and it may plogely enough be fail, that holly will grow
